

Skill Ramp-Up Plan – Part 1 (up to Hello World on Vercel)

#author : Laurent GAUTHIER

Welcome

I'm really excited to present this training, designed specifically for you!

This first part will help you discover the basics. We'll move forward through hands-on exercises, with a deliverable at each step.

It's a self-training program: no one will check whether you've done it or not — we trust you.

A few simple rules:

- Share your progress at the end of the day
- Ask questions if you're stuck or need help
- Don't hesitate to request support at any time

Good luck, and enjoy the journey!

Block 0 – AI Support

- I have access to ChatGPT or Claude Code.
- I know how to ask clear questions when I'm stuck (context, error, goal).
- I can ask the AI to explain a concept in simple terms.
- I know how to request example code, adapt it, and test it myself.

Definition of Done

When I hit a blocker, I can ask a precise question to the AI, apply the answer, and move forward.

Block 1 – Technical Prerequisites

- I know how to use my computer for coding (Windows, Linux, or Mac).
- I have installed a terminal (Git Bash, iTerm, or native).
- I have a GitHub account configured with an SSH key.
- I know how to clone a repository from GitHub.
- I can open and edit code in VSCode.

Definition of Done

I can open VSCode, clone a GitHub repo with SSH, and see the project files on my

computer.

Block 2 – Survival Commands

- I know how to navigate with basic Linux commands (`ls` , `cd` , `mkdir` , `rm` , `cat` ...).
- I know how to open, edit, and save a file with `nano` or `vim` .
- I can check the version of an installed tool (`node -v` , `npm -v`).

Definition of Done

I can create a folder, write a simple text file, edit it with `nano` or `vim` , and display it with `cat` .

Block 3 – Git & GitHub

- I know how to create a GitHub repository.
- I know how to clone a repository locally.
- I can create a commit and push it to GitHub.
- I know how to pull changes from GitHub.

Definition of Done

I create a GitHub repo with a `README.md` , clone it, modify it locally, push my changes, and see them on GitHub.

Block 4 – Frontend Basics (without frameworks)

- I know how to create an `index.html` file with a minimal structure (`<!DOCTYPE html>` , `<html>` , `<head>` , `<body>`).
- I know how to display "Hello World" text on my page.
- I can create a `style.css` file and link it to my `index.html` .
- I know how to change the appearance of an element with CSS (e.g., color, size, font).
- I can create a `main.js` file and link it to my `index.html` .
- I know how to select an HTML element with `document.querySelector` .
- I can add a button to my page.
- I know how to use `addEventListener('click', ...)` on the button.
- I know how to update text dynamically with `innerText` or `innerHTML` .
- I can implement a counter that increments every time I click the button.

Definition of Done

My project contains 3 files (`index.html` , `style.css` , `main.js`):

- The page displays "Hello World"
 - A button is visible
 - When I click the button, a counter increments and is displayed on the page
-

Block 5 – Local Server

- I have installed Node.js and npm.
- I know how to initialize a project with `npm init -y`.
- I can start a local server with `npm run dev` (or `python -m http.server`).
- I know how to open my page on `http://localhost:3000`.

Definition of Done

I can open my browser at `http://localhost:3000` and see my Hello World page with the button and counter.

Block 6 – Deployment on Vercel

- I create a Vercel account linked to my Github account
- I know how to import a GitHub project into Vercel (via “Add New Project”).
- I know how to select the repo created in Block 3.
- I know how to configure the project as a **Static Site** (no custom config, use defaults).
- I know how to trigger a deployment (Vercel runs the build automatically).
- I know how to access my site using the generated Vercel URL.

Definition of Done

I can share the Vercel URL of my Hello World page (with button + counter) and anyone can access it online.

Block 7 – Validation

- I can repeat the entire process by myself: write HTML/CSS/JS → push to GitHub → deploy to Vercel.
- I know how to check that my site works both locally and online.
- I know how to create a Git branch, make changes there, and open a Pull Request (PR) on GitHub.

- I can submit my PR to my Lead on the repo created in Block 3.

Definition of Done

- I am able to redo all steps without help.
- I have a Hello World page with button + counter deployed publicly on Vercel.
- I have created a branch, submitted a PR on GitHub, and my Lead can review it.
